

Solution Requirements

Project: Employee Software Installation Request (ServiceNow)

1. Functional Requirements

The following functional requirements define the features and capabilities that the proposed ServiceNow solution must provide.

Requirement ID	Functional Requirement	Priority
FR-01	The system shall provide a Service Catalog item that enables employees to submit software installation requests.	Must Have
FR-02	The system shall capture essential request details, including Software Name, Software Version, Business Justification, Installation Device, License Type, and Required Installation Date.	Must Have
FR-03	The system shall automatically route each submitted request to the employee's reporting manager for approval.	Must Have
FR-04	The manager shall be able to review, approve, or reject requests through the My Approvals interface.	Must Have
FR-05	Upon manager approval, the system shall automatically create a Catalog Task and assign it to the Network/Software Support team for software installation.	Must Have
FR-06	If a request is rejected, the system shall notify the employee and display the manager's comments or rejection reason.	Must Have
FR-07	If the requested software cannot be installed due to license unavailability, the system shall automatically create an Incident for the Software Support team.	Should Have
FR-08	The system shall send email notifications to employees whenever the request is approved, rejected, or completed.	Should Have
FR-09	Employees shall be able to monitor the status of their requests through the My Requests portal.	Should Have
FR-10	The system shall enforce role-based access so that employees can view only their own requests, while managers can view requests submitted by their team members.	Could Have

2. Non-Functional Requirements

The following non-functional requirements define the quality attributes of the proposed solution.

Category	Requirement
Usability	The software request form should be simple, intuitive, and easy to complete within two minutes by non-technical users.
Performance	Approval requests should be routed automatically within a few seconds after request submission using ServiceNow Flow Designer.
Reliability	Every submitted request must be successfully processed and assigned to the appropriate manager without being lost.
Security	Only authorized users should have access to request information. Managers should only approve requests assigned to them, while employees can access only their own requests.
Auditability	Every request, approval decision, status update, and task assignment must be recorded with timestamps to support auditing and compliance.
Maintainability	Business logic should be implemented using reusable ServiceNow components such as Flow Designer and Business Rules, minimizing hardcoded configurations for easier maintenance and future enhancements.

3. Assumptions

The proposed solution is based on the following assumptions:

- Every employee has a valid reporting manager configured in their ServiceNow user profile.
- The organization uses a single ServiceNow Service Catalog for submitting software installation requests.
- Software license availability is managed at a basic level during this phase. If a license is unavailable, the request is placed on hold and an incident is automatically generated.
- Email notifications are properly configured within the ServiceNow instance.
- The Network/Software Support team is responsible for fulfilling approved software installation requests.

4. Out of Scope (Current Phase)

The following features are intentionally excluded from the current implementation and may be considered in future phases:

- Automatic software license inventory management and license allocation.
- Integration with external software deployment tools such as Microsoft SCCM, Microsoft Intune, or similar endpoint management solutions.
- Multi-level approval workflows involving department heads or multiple approvers.
- Automatic software installation on employee devices without IT intervention.
- Integration with third-party asset management or procurement systems.

Summary

The proposed solution leverages ServiceNow's native Service Catalog, Approval Workflow, Flow Designer, and Task Management capabilities to automate the software installation request process. It provides a standardized and secure workflow that improves efficiency, reduces manual effort, ensures accountability, and offers complete visibility into every stage of the request lifecycle. The defined functional and non-functional requirements establish a strong foundation for implementing a scalable and maintainable enterprise solution.
